Overview

The purpose of the Red Hat writing test is to assess your research, testing, and technical writing skills. These are key skills required by Technical Writers at Red Hat. There is no strict time limit for the test, however you should be able to complete it within three hours. It is not necessary to complete the test in one sitting.

Background

Open Source API Management (apiman) is an upstream community project. Information about apiman, including user documentation, is available on the apiman project website, http://www.apiman.io/.

Task

Write an enterprise quality article that will help new users to get started with apiman. You may refer to the information provided on the apiman project website to assist you with this task. The article must provide the following information:

- a brief overview of apiman, including what it is and why you would want to use it
- instructions to download and install the latest version of apiman (on WildFly 10) and start the server
- a basic example based on the *echo-service* quickstart, demonstrating how to configure an API provider and consumer, and test a defined usage policy

Use the writing style and presentation that you believe to be most suitable for an enterprise quality article. Use your own judgement to determine the appropriate length of the article. The final document should be submitted as a .pdf file.

Stretch task

Write a simple procedure of your choice (e.g., how to make a bed) in HTML or Markdown and publish it using GitHub Pages. While you should use the writing style and presentation that you believe to be most suitable, the content of this procedure will not be assessed. Send us the link to your GitHub Pages site displaying your procedure and the link to your GitHub repository containing your source code.
